FOR CHARITIES AND ALTERNATIVE PROVISION

Outcome measure analysis

Whether the change in your before-and-after scores is real, how large it is, and who it is happening for.

Who it's for

- Charities using wellbeing or progress measures such as WEMWBS, the Outcomes Star or their own scales
- Alternative provision and tuition providers recording SDQ, Boxall Profile, attendance or attainment at start and review
- Organisations whose funders ask for outcomes, not just numbers through the door

The question it answers

Did people's scores improve by more than chance and measurement error would explain, by how much, and does the change differ by group, programme or length of involvement?

What you get

- Change on each measure: the average change, how large it is in standard terms (effect size) and how sure we can be
- Reliable change: how many people improved, stayed the same or got worse by more than the measure's margin of error, where the measure supports it
- Who benefits most: change by group, site, programme or sessions attended, with small samples flagged
- Follow-up: how many people have both a start and a follow-up score, and whether those without one differ
- A 3–4 page report with charts and plain-English commentary, plus the workbook so you can rerun it next year

What I need from you

- Start and follow-up scores for each person, pseudonymised (participant codes, not names)
- Which measure each score comes from, and when it was taken
- Any groupings to compare, such as site, programme or sessions attended

How it works

- 30-minute call to agree the measures and comparisons
- Secure transfer of pseudonymised scores under a written data agreement
- Report and workbook delivered within 10 working days
- One round of changes included

Example finding

The average wellbeing score rose by only a few points, which looked modest. But four in ten participants improved by more than the measure's margin of error, fewer than one in ten got worse, and almost all of the reliable improvement came from people who attended eight or more sessions.

Illustrative example only, not a client result.

£600–£950 fixed price

Depends on the number of measures and comparisons. Confirmed before work starts. Invoiced on booking, payable on delivery. No VAT is added.

Best time: At the end of a programme or grant period, or once at least 20 people have both a start and a follow-up score.

Your data. This work uses pseudonymised scores (codes, not names). That is still personal data, and wellbeing and mental-health measures are special-category (health) data, so it runs only under a written data processing agreement. You confirm first that your lawful basis covers using the scores for this analysis, including sending them to me, and that you have a condition for processing special-category data (UK GDPR Articles 6 and 9). You stay in control, data is held in an agreed secure location, used only for this work, and deleted at the end.

Next step: email **stephen@zktheory.org** with a line about what you need and when it's due. I'll reply within two working days with whether I can help and a fixed price.
